ENGINEERING CERTIFICATION

This report and drainage plan for the Phase III: Drainage Design of Canyon Vista Subdivision was prepared by me (or under my direct supervision) in accordance with the provisions of the "Drainage Planning Submittal Requirements" of Coconino County and other regulations of the Coconino County Flood Control District. I understand that Coconino County does not, and will not, assume liability for the drainage facilities designed by others.

SIGNATURE: _____

Luke Sefton, Registered Professional Engineer

State of ARIZONA

No: 37322

DEVELOPER CERTIFICATION

William Heyer hereby certifies that the drainage facilities for Canyon Vista Subdivision shall be constructed according to the design presented in this report.

I understand that the City of Sedona does not, and will not, assume liability for the drainage facilities designed and/or certified by my engineer, and that the City of Sedona review of drainage plans pursuant to the Arizona Revised Statutes, Chapter 21, Article 1, 48-3601 to 48-3628; but cannot, on behalf of Canyon Vista Subdivision, guarantee that final drainage design review will absolve William Heyer and/or their successors and/or assigns of future liability for improper design. I further understand that approval of the Final Plat does not imply approval of my engineer's drainage design.

I. LOCATION AND DESCRIPTION

A. LOCATION

Canyon Vista Subdivision is situated in Coconino County, Arizona, within the City of Sedona. It is specifically located at Assessor's Parcel Number 401-20-027G, which is the NW ¼ of the NE ¼ Section 18, Township 17 North, Range 6 East, and Gila & Salt River Base & Meridian. The property can be accessed from Brewer Road. A primitive road, Denise Lane, travels generally through the center of the property.

1. Project Owner/Developer: CV DEVELOPMENT Sedona, Inc
5018 Shoal Creek Blvd
Austin, Texas 78756
2. Streets and Roadway: Private roadways (Proposed on-site)
3. Major Drainage Ways and Facilities:

A FEMA flood status report shows this property being out of any floodplain area (Map 04025C7657H, March 21, 2023) **(See Appendix A)**.

There are no major drainage ways on the property, but two major ones are located within half a mile. The Oak Creek Floodplain is situated half a mile south of the property, while the Soldier Wash Floodplain is located half a mile east. Two washes, named Juniper Creek Tributary 1 and Juniper Creek Tributary 2, are identified in the City of Sedona Flood Plain Management Study conducted by the United States Department of Agriculture Soil Conservation Service. The wash identified as Juniper Creek Tributary 1 flows in a west to east direction through the southern end of the property and towards Oak Creek Wash. The wash identified as Juniper Creek Tributary 2 is situated just north of the property boundary and flows from west to east direction towards Soldier Wash. These washes are tributaries to Oak Creek.

Les Springs Subdivision lies to the northwest of the property with Coconino National Forest to the west and north of the property. Surrounding zoning is National Forest (NF) to the west, Planned Residential Development (PRD) to the northwest, Single Family Residential (RS-18b) to the north, and Single Family Residential (RS-10b) to the east and south.

The project involves the development of 11 lots within a proposed subdivision. To provide access to these lots, a road will be constructed running uphill through the property, ultimately connecting to Brewer Road. The road will serve as the primary route for accessing the subdivision and has been designed considering the site's topography and drainage requirements.

B. DESCRIPTION OF PROPERTY

The proposed development of Canyon Vista Subdivision encompasses 5.71 acres of land. The site has an existing primitive road named Denise Lane that runs through the property from Brewer Road. The project area consists of approximately 50 percent vegetative cover consisting of mesquite, brush and grass. The general area consists of a SCS D type soil which consists of nearly level to very steep, well-drained soils that are only 8 to 20 inches deep over basal, permeability is slow. There are no irrigation ditches or canals on this site. The site is situated at the base of a large ridge which extends along the north and west property boundary with two drainage channels running in a west to east direction through the project area. The drainage channel on the south end of the property can be identified as Juniper Creek Tributary 1 in the City of Sedona 2022 Storm Water Master Plan Update (**Appendix B**). The area has a high, 10 to 15 percent, slope, with 100% slopes in some areas, which declines in a northwest to southeast direction. The site is currently zoned as Single Family Residential (RS-10b) and it is proposed for a subdivision of 11 residential lots.

II. DRAINAGE BASINS AND SUB-BASINS

A. MAJOR BASIN

City of Sedona 2022 Storm Water Master Plan Update (Appendix B) was referenced and used in this report. A flood status report shows this property being out of any floodplain (See Appendix A).

There are no irrigation facilities, detention basin, or irrigation system, within the project area. Soil data was gathered from Natural Resources Conservation Services (NRCS) website (**Appendix C**). The soil type consists of Tunist soils, Rock outcrop and Urban land and Sedona soils. Tunist soils and urban lands with map unit symbol of 405 and 406. Each soil belongs to hydrologic soil group D and soil texture classification is moderately fine texture to sandy texture.

The proposed Canyon Vista Subdivision development will be situated among two major drainage basins as shown in the Appendix B. The major drainage basins are identified as Juniper Creek Tributary 1 and Juniper Creek Tributary 2 (See Appendix B). The 5.24 acres of the proposed development will be considered as a portion of drainage basin Juniper Creek Tributary 1. The 0.47 acres located on the northwest corner of the proposed development area, Sub-Basin will be considered as a portion of drainage basin Juniper Creek Tributary 2 3A (**See Appendix D**). Drainage basins Juniper Creek Tributary 1 and Juniper Creek Tributary 2 typically drain in a west to east direction throughout the property and consist of sheet flow and shallow channel flow.

B. SUB-BASIN DESCRIPTION

The two major drainage basins were sub-divided into on-site and off-site basins to further determine the impact of development on the surrounding areas (See Appendix D).

Luke Sefton, PE, CFM
Tim Huskett, PE, CFM
Robert Lane, Public Lands
Cheri Baker, Office Manager
Crockett Saline, PE
David Nicolella, Planner
Leonard Filner, Planner

1. On-site Basin:

Four sub-basins were delineated within the boundaries of the proposed development. The sub-basins are identified as sub-basins 3A, 4A, 5A and 6A. Sub-Basin 3A is a portion of the drainage area of Juniper Creek Tributary 2. Drainage in Sub-Basin 3A will typically consist of sheet flow in a southwest to north direction. Sub-Basins 4A, 5A and 6A are portions of the drainage area for Juniper Creek Tributary 1. Drainage in Sub-Basin 4A will consist of sheet flow to localized shallow channel flow which flows in a west to east direction from the western to the eastern property boundaries. Drainage in Sub-Basin 5A will consist of sheet flow to localized shallow channel flow which flows in a west to east direction from the western to the southern property boundaries. Drainage in Sub-Basin 6A will also consist of sheet flow to localized shallow channel flow which flows in a north to south direction within the proposed development area.

2. Off-site Basin:

Two sub-basins were delineated beyond the proposed development area in order to determine the off-site drainage basins which contribute to the on-site basins. Sub-Basin 1A is a portion of the drainage area of Juniper Creek Tributary 1 and is a portion of the western bordering undeveloped area of the Coconino National Forest. Drainage in Sub-Basin 1A is predominately channel flow in a west to east direction entering the site on the existing western property boundary. These stormwaters convey by natural means through the site in concentrated flows and leaves the site on the eastern property boundary. Sub-Basin 2A is also a portion of the drainage area of Juniper Creek Tributary 1 and borders an undeveloped area of the Coconino National Forest. Drainage in Sub-Basin 2A is predominately channel flow in a west to east direction entering the site area on the western property boundary. These stormwaters convey by natural means through the site in concentrated flows and leaves the site on the eastern property boundary.

Table 1 addresses the physical properties of the Sub-Basins delineated for this drainage study (See Pre-Development Map, Appendix D).

Table 1 – Pre-Development Basin Characteristics

Basin Designation	Area	Channel Length	Elevation Delta	Slope
	(Acre)	(Ft)	(Ft)	(Ft/Ft)
1A	20.6	2231	601	0.27
2A	1.34	207	16.7	0.08
3A	1.09	251	61.5	0.25
4A	1.53	334	65	0.19
5A	2.64	276	71.3	0.26
6A	1.06	310	71	0.23
7A	0.25	101	15.4	0.15
8A	0.22	61	5.75	0.09

III. DRAINAGE DESIGN CRITERIA

A. DEVELOPMENT CRITERIA AND RESULTS

The development of Canyon Vista Subdivision is within the study area of the “City of Sedona 2022 Stormwater Master Plan, dated June 2022. Development within the proposed project area therefore is constrained in that the natural drainage patterns and networks should not be significantly altered or post-development discharge conditions should not increase beyond pre-development discharge conditions.

B. HYDROLOGIC CRITERIA AND RESULTS

1. Design Rainfall

Information for Intensity-Duration-Frequency curves was gathered from the National Oceanic and Atmospheric Administration’s (NOAA) National Weather Service website. The following data from the NOAA National Weather Service website was used for all the calculations for runoff. **(See Appendix E)**

Using the values from the National Weather Service the following table was developed which was then used to create an Intensity-Duration-Frequency curve. The values in the table were then imported and used in the HydraFlow Hydrographs 2024 modeling program to conduct a hydrologic analysis of the area.

2. Runoff Method

- a. The Runoff Method is a continuation of the Rational Method with watershed areas less than the 160-acre limit and was conducted as outlined in Chapter 2 Rational Method of the Highway Drainage Design Manual.
- b. The Rational Method is based on the equation $Q=CIA$ (Appendix C, equation 2-1) where Q is the peak flow in cubic feet per second, C is the runoff coefficient, i is the average rainfall intensity in inches per hour and A is the contributing drainage area in acres.
- c. The intensity in the Rational Method equation is the average rainfall intensity for rainfall of a selected return period for a rainfall duration that is equal to the time of concentration. Minimum rainfall duration of 10 minutes was used if the calculated Time of Concentration was less than 10 minutes.
- d. The Time of Concentration was determined by using the equation of $T_c=11.4*L^{0.5} *K_b 0.52 *S^{-0.31}*i^{-0.38}$ (Appendix C, equation 2-2) where L is the length of the longest flow path in miles, K_b is the resistance coefficient, S is the slope of the longest flow path in feet per mile and i is the average rainfall intensity in inches per hour. The Resistance Coefficient (K_b) for the undeveloped site was foothills (0.05), and for the developed site, was paved and buildings with undeveloped land (0.03) as per Arizona Department of Transportation (ADOT) hydrology manual

3. Detention calculation method

HydraFlow Hydrographs 2024 were utilized to compute the detention ponds. Five small detention ponds and one large pond was designed to manage excess water. These ponds will make the runoff below the pre-development levels.

For offsite basin 1A and onsite basin 2A, three small ponds are proposed within basin 2A to manage excess runoff generated by the three lots. These ponds vary in depth from 1 to 2 feet. The first pond, located south of Lot 1 along the southern boundary, is 1 foot deep with a weir opening of 0.2 feet and a length of

Luke Sefton, PE, CFM
Tim Huskett, PE, CFM
Robert Lane, Public Lands
Cheri Baker, Office Manager
Crockett Saline, PE
David Nicolella, Planner
Leonard Filner, Planner

1 foot. The second pond, situated between Lot 1 and Lot 2, is also 1 foot deep with a weir opening of 0.2 feet and a length of 15 feet. The third pond, located at the southwestern corner of Lot 3, is 2 feet deep with a weir opening of 0.2 feet and a length of 10 feet. These ponds are designed to mitigate the excess runoff caused by the development in basin 2A.

Runoff from offsite basin 3A will flow onto the proposed road, where it will be directed toward the pond in onsite basin 6A. Additionally, part of the runoff from onsite basin 4A will also be channeled along the road. The remaining runoff from onsite basins 4A and 5A will follow the natural drainage path, maintaining the existing flow conditions across the site.

Onsite basin 6A will feature a large retention pond with a capacity of 2,187 cubic feet. This pond is designed to accommodate runoff from offsite basin 3A, a portion of onsite basin 4A, and all of onsite basin 6A. The pond ensures effective management of runoff by capturing and controlling the flow from these basins, helping to mitigate potential flooding or excess water discharge. The pond includes a weir outlet with a 0.5-foot thick opening and a length of 15 feet, allowing for controlled release of excess water and ensuring that post-development conditions maintain consistent runoff levels.

For onsite basins 7A and 8A, two separate retention ponds have been proposed to manage the excess runoff generated by these areas. The design of these ponds ensures that post-development runoff levels remain consistent with pre-development conditions, preventing any rise in runoff and maintaining the natural drainage patterns. These ponds are strategically placed to effectively capture and manage the increased water flow, ensuring compliance with stormwater management goals and minimizing the impact on surrounding properties.

For Lot 11, which is not within any designated on-site or off-site drainage basin, a pond has been proposed in accordance with City of Sedona guidelines. The guideline specifies providing 50 cubic feet of storage for every 1,000 square feet of impervious area. A pond with a capacity of 431 cubic feet has been planned between Lot 10 and Lot 11, as depicted in the site plans. This pond is designed to effectively capture the excess runoff generated by Lot 11, ensuring no adverse impact on downstream flow.

This setup aids in managing post-development flows, ensuring they remain below pre-development HydraFlow Hydrographs 2024 were instrumental in the calculation of these detention ponds.

4. Storm Recurrence Intervals

Results are presented for the 2, 5, 10, 25, 50 and 100-year events

5. Other Hydrologic Criteria / Methods

No additional hydrologic criteria / methods are requested or anticipated.

6. Hydrologic Results

Using HydraFlow Hydrographs 2024 hydrologic modeling program the first model created was to establish the pre-development drainage of all off-site and on-site sub-basins affecting the project area. The following table summarizes the results of the pre-development model in Appendix G.

Table 3 Pre-Development Discharges

PRE-DEVELOPMENT DISCHARGES (cfs)						
Design Pt.	2-yr Peak	5-yr Peak	10-yr Peak	25-yr Peak	50-yr Peak	100-yr Peak
1	23.56	31.68	38.61	48.35	56.43	65.05
2	1.532	2.061	2.511	3.145	3.67	4.232
3	1.246	1.676	2.043	2.558	2.986	3.442
4	1.75	2.353	2.868	3.591	4.191	4.832
5	3.019	4.06	4.948	6.196	7.231	8.337
6	1.212	1.63	1.987	2.488	2.903	3.347
7A	0.286	0.384	0.469	0.587	0.685	0.789
8A	0.252	0.338	0.412	0.516	0.603	0.695

The second model created was to establish the post-development drainage which takes into account the development of the project area but no drainage mitigation is established. The following table summarizes the results of the post-development model in Appendix G.

Table 4 Post-Development Discharges-no mitigation

POST-DEVELOPMENT DISCHARGES (cfs)						
Design Pt.	2-yr Peak	5-yr Peak	10-yr Peak	25-yr Peak	50-yr Peak	100-yr Peak
1	23.56	31.68	38.61	48.35	56.43	65.05
2	1.873	2.519	3.069	3.844	4.486	5.172
3	1.532	2.061	2.511	3.145	3.67	4.232
4	1.944	2.614	3.186	3.99	4.657	5.368
5	3.22	4.331	5.278	6.609	7.713	8.893
6	1.643	2.21	2.693	3.372	3.936	4.538
7A	0.413	0.555	0.677	0.847	0.989	1.14
8A	0.302	0.406	0.495	0.62	0.723	0.834

Luke Sefton, PE, CFM
Tim Huskett, PE, CFM
Robert Lane, Public Lands
Cheri Baker, Office Manager
Crockett Saline, PE
David Nicolella, Planner
Leonard Filner, Planner

The third model created was to establish the post-development drainage with the establishment of a drainage network that will mitigate the runoff discharges. The following table summarizes the results of the post-development with detention model in Appendix G.

Table 5 Post-Development with Detention Implementation

POST-DEVELOPMENT W/ DETENTION DISCHARGES (cfs)							WITHOUT DETENTION BASIN (cfs)	Difference
Design Pt.	2-yr Peak	5-yr Peak	10-yr Peak	25-yr Peak	50-yr Peak	100-yr Peak	100-yr Peak	100-yr Peak
1	23.61	31.69	38.61	48.17	56.29	65.05	65.05	0
2	23.84	33.14	40.11	50.19	58.69	68.03	70.22	-2.19
3	1.249	1.677	2.043	2.549	2.978	3.442	3.442	0
4	2.747	3.688	4.493	5.606	6.55	7.571	7.571	0
5	0	1.704	3.84	6.376	8.537	10.59	12.52	-1.93
6	1.757	4.464	0	0.829	1.797	2.714	4.495	-1.781
7A	0	0	0	0.313	0.525	0.726	1.14	-0.414
8A	0	0	0	0	0.17	0.416	0.834	-0.418

The increase in runoff from the Pre-Development to the Post-Development is due to the development of the project area. The decrease in runoff between Pre-Development and Post-Development with detention is due to the implementation of a detention basin that mitigates the off-site and on-site drainage areas. The increase in runoff will have no significant impact to the surrounding areas or drainage ways. Post development drainage map can be accessed in **Appendix H**.

C. HYDRAULIC CRITERIA

The procedure and design criteria outlined in Yavapai County Drainage Manual Chapter 6 and Chapter 8 was followed when performing hydraulic analysis. HydraFlow Express was also used in sizing and designing culverts and channels used in this project. No additional hydrologic criteria/methods are requested or anticipated.

Luke Sefton, PE, CFM

IV. DRAINAGE FACILITY DESIGN

A. GENERAL CONCEPT

1. The development of Canyon Vista Subdivision increased the overall runoff as shown when comparing the Post-development discharges (Table 5) to the Pre-development discharges (Table 4). To reduce the Post-development discharges Three detention basins and Two retention basins will be implemented into the development of the site to reduce the overall runoff discharges below the Pre-development levels.

2. To reduce the impact of development on overall runoff peak discharges the Pre-development drainage patterns will typically be followed with little modifications. Areas of development that obstruct the pre-development drainage patterns will be modified with a drainage structure that returns the runoff discharge to a pre-development condition.

3. The following tables and figures were included in this report for further clarification and summarization of data.

a. Table 1: Summarizes the physical characteristics of each sub-basin delineated for this project.

b. Table 2: Shows pre and post developments runoff coefficient and areas

c. Table 3: Shows the calculated Pre-development peak discharge for the required storm recurrence intervals for each sub-basin and concentration point.

d. Table 4: Shows the calculated Post-development peak discharges for the required storm recurrence intervals for each sub-basin and concentration point.

j. Table 5: Shows the calculated Post-development with Detention Implementation peak discharges for the required storm recurrence intervals for each sub-basin and concentration point.

B. SPECIFIC DETAILS

1. Design Point 1, with a 100-year peak discharge (Q100) of 65.05 cfs, represents the influx from off-site sub-basin 1A into on-site sub-basin 2A along the western property boundary. Then this will be directed towards the channel provided at Design Point 2 where the peak discharge reaches (Q100) 69.28 cfs. If the water volume exceeds the capacity of this channel, overflow onto the road will occur, allowing natural drainage through the pre-existing channel.

2. Design Point 3, with a Q100 of 3.442 cfs, represents the 100-year peak discharge from off-site sub-basin 3A into on-site sub-basin 4A along the western property boundary. This discharge will

Luke Sefton, PE, CFM
Tim Huskett, PE, CFM
Robert Lane, Public Lands
Cheri Baker, Office Manager
Crockett Saline, PE
David Nicolella, Planner
Leonard Filner, Planner

be directed through the proposed road and will be collected in the pond proposed near Brewer Road to reduce its peak.

3. Design Point 4, having a Q100 of 6.947 cfs, denotes the 100-year peak discharge from on-site sub-basin 4A, exiting on-site sub-basin 4A. This discharge will not intervene, and it will follow its natural flow path, passing through on-site sub-basin 5A, and into a pre-existing channel which will be considered as a design point 6.
4. Design Point 5, with a Q100 of 11.40 cfs, signifies the 100-year peak discharge from on-site sub-basin 4A, leaving on-site sub-basin 4A and on site sub-basin 5A. This discharge will be routed through a pre-existing channel, ultimately flowing to the east side of the adjacent property (Design Point 6).
5. Design Point 6 is where the runoff from on-site sub-basins 4A, 5A, and 6A converges before flowing in its natural path. This point plays a crucial role in managing and directing the water from these basins, ensuring that it follows the intended drainage course and minimizes any adverse impacts on the site or surrounding areas. Properly accounting for the flow at this design point helps maintain effective stormwater management and aligns with the overall drainage strategy for the development.
6. Design Point 2 is where the runoff exits the property, making it a critical location for assessing the effectiveness of the drainage system. By comparing the flow rates at Design Points 2 and 6, it can be determined whether the excess runoff generated within the property is being adequately captured and managed on-site. Based on the comparison shown in Tables 3, 4, and 5, it is evident that the designed drainage measures successfully capture the excess runoff, resulting in no increase in the runoff when it exits the property. This confirms that the post-development runoff levels are consistent with pre-development conditions, ensuring compliance with drainage management requirements.

V. CONCLUSIONS

In the engineer's professional assessment, it is recommended that the site be constructed according to the proposed plan. This plan is designed to meet all necessary conditions while ensuring cost-effectiveness and requiring minimal maintenance for drainage facilities. The implemented facilities will effectively mitigate any expected increases in runoff associated with the development. Furthermore, the project fully adheres to the criteria set forth by the City of Sedona.

MAP PANELS

- Digital Data Available
- No Digital Data Available
- Unmapped

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards.

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 10/7/2023 at 4:30 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Black Hills-Sedona Area, Arizona, Parts of Coconino and Yavapai Counties

Survey Area Data: Version 13, Sep 8, 2023

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Oct 29, 2022—Oct 31, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
405	Turist soils, Rock outcrop and Urban land, 15 to 90 percent slopes	3.2	48.1%
406	Sedona soils, Turist soils and Urban land, 3 to 15 percent slopes	3.5	51.9%
Totals for Area of Interest		6.7	100.0%

Black Hills-Sedona Area, Arizona, Parts of Coconino and Yavapai Counties

406—Sedona soils, Turist soils and Urban land, 3 to 15 percent slopes

Map Unit Setting

National map unit symbol: 1yld
Elevation: 3,700 to 5,000 feet
Mean annual precipitation: 16 to 20 inches
Mean annual air temperature: 57 to 62 degrees F
Frost-free period: 160 to 210 days
Farmland classification: Not prime farmland

Map Unit Composition

Sedona and similar soils: 34 percent
Turist and similar soils: 33 percent
Urban land: 33 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Sedona

Setting

Landform: Hills
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Convex
Across-slope shape: Convex
Parent material: Colluvium and/or residuum weathered from shale and/or mudstone

Typical profile

A - 0 to 2 inches: extremely channery loam
Btk1 - 2 to 10 inches: extremely channery silty clay loam
Btk2 - 10 to 18 inches: extremely flaggy silt loam
Cr - 18 to 60 inches: bedrock

Properties and qualities

Slope: 3 to 15 percent
Depth to restrictive feature: 12 to 18 inches to paralithic bedrock
Drainage class: Well drained
Runoff class: High
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Calcium carbonate, maximum content: 5 percent
Maximum salinity: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)

Available water supply, 0 to 60 inches: Very low (about 1.1 inches)

Interpretive groups

Land capability classification (irrigated): None specified

Land capability classification (nonirrigated): 6s

Hydrologic Soil Group: D

Ecological site: R038XB218AZ - Sandstone Hills 16-20

Hydric soil rating: No

Description of Turist

Setting

Landform: Hills

Landform position (two-dimensional): Backslope

Landform position (three-dimensional): Side slope

Down-slope shape: Convex

Across-slope shape: Convex

Parent material: Residuum weathered from sandstone

Typical profile

A - 0 to 1 inches: very channery sandy loam

Bw - 1 to 5 inches: channery clay loam

Bk1 - 5 to 10 inches: extremely channery loam

Bk2 - 10 to 16 inches: extremely channery loam

2R - 16 to 60 inches: bedrock

Properties and qualities

Slope: 3 to 15 percent

Depth to restrictive feature: 12 to 18 inches to lithic bedrock

Drainage class: Well drained

Runoff class: High

Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately high (0.00 to 0.20 in/hr)

Depth to water table: More than 80 inches

Frequency of flooding: None

Frequency of ponding: None

Calcium carbonate, maximum content: 5 percent

Maximum salinity: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)

Available water supply, 0 to 60 inches: Very low (about 1.2 inches)

Interpretive groups

Land capability classification (irrigated): None specified

Land capability classification (nonirrigated): 6s

Hydrologic Soil Group: D

Ecological site: R038XB218AZ - Sandstone Hills 16-20

Hydric soil rating: No

Description of Urban Land

Interpretive groups

Land capability classification (irrigated): None specified

Land capability classification (nonirrigated): 8s

Hydric soil rating: No

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS). Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values. Please refer to NOAA Atlas 14 document for more information.

ADOT DRAINAGE DESIGN MANUAL EXCERPTS AND CALCULATIONS

CHAPTER 2

RATIONAL METHOD

2.1 INTRODUCTION

The Rational Method relates rainfall intensity, a runoff coefficient and a drainage area size to the direct runoff from the drainage basin.

Three basic assumptions of the Rational Method are:

- a. The frequency of the storm runoff is the same as the frequency of the rainfall producing the runoff (i.e., a 25-year runoff event results from a 25-year rainfall event).
- b. The peak runoff occurs when all parts of the drainage basin are contributing to the runoff.
- c. Rainfall is uniform over the watershed.

2.1.1 General Discussion

The Rational Method, as presented herein, can be used to estimate peak discharges, the runoff hydrograph shape, and runoff volume for small, uniform drainage areas that are not larger than 160 acres in size. The method is usually used to size drainage structures for the peak discharge of a selected return period. An extension of the basic method is provided to estimate the shape of the runoff hydrograph if it is necessary to design retention/detention facilities and/or to design drainage facilities that will require routing of the runoff hydrograph through the structure.

The Rational Method is based on the equation: $Q = CiA$ (2-1)

where Q = the peak discharge, in cfs, of selected return period,
 C = the runoff coefficient,
 i = the average rainfall intensity, in inches/hr, of calculated rainfall
duration for the selected rainfall return period, and
 A = the contributing drainage area, in acres.

2.2 PROCEDURE

2.2.1 General Considerations

1. Depending on the intended application, the runoff coefficient (C) should be selected based on the character of the existing land surface or the projected character of the land surface under future development conditions. In some situations, it may be necessary to estimate C for both existing and future conditions.
2. Land-use must be carefully considered because the evaluation of land-use will affect both the estimation of C and also the estimation of the watershed time of concentration (T_C).
3. The peak discharge (Q) is generally quite sensitive to the calculation of T_C and care must be exercised in obtaining the most appropriate estimate of T_C .
4. Both C and the rainfall intensity (i) will vary if peak discharges for different flood return periods are desired.
5. Since the T_C equation is a function of rainfall intensity (i), T_C will also vary for different flood return periods.

2.2.2 Applications and Limitations

1. The total drainage area must be less than or equal to 160 acres.
2. T_C shall not exceed 60 minutes.
3. The land-use of the contributing area must be fairly consistent over the entire area; that is, the area should not consist of a large percentage of two or more land-uses, such as 50 percent commercial and 50 percent undeveloped. This will lead to inconsistent estimates of T_C (and therefore i) and errors in selecting the most appropriate C coefficient.

4. The contributing drainage area cannot have drainage structures or other facilities in the area that would require flood routing to correctly estimate the discharge at the point of interest.
5. Drainage areas that do not meet the above conditions will require the use of an appropriate rainfall-runoff model (the HEC-1 Program) to estimate flood discharges.

2.2.3 Estimation of Area (A)

An adequate topographic map of the drainage area and surrounding land is needed to define the drainage boundary and to estimate the area (A), in acres. The map should be supplemented with aerial photographs, if available, especially if the area is developed. If the area is presently undeveloped but is to undergo development, then the land development plan and maps should be obtained because these may indicate a change in the drainage boundary due to road construction or land grade changes. If development plans are not available, then land-use should be based on current zoning of the area.

The delineation of the drainage boundary needs to be carefully determined. The contributing drainage area for a lower intensity storm does not always coincide with the drainage area for more intense storms. This is particularly true for urban areas where roads can form a drainage boundary for small storms but more intense storm runoff can cross roadway crowns, curbs, etc. resulting in a larger contributing area. Floods on alluvial fans (active and inactive) and in distributary flow systems can result in increased contributing drainage areas during larger and more intense storms. It is generally prudent to consider the largest reasonable drainage area in such situations.

2.2.4 Estimation of Rainfall Intensity (i)

The intensity (i) in Equation 2-1 is the average rainfall intensity in inches/hour for the period of maximum rainfall of a specified return period (frequency) having a duration equal to the time of concentration (T_C) for the drainage area. The frequency is usually specified according to a design criteria or standard for the intended application. The

rainfall intensity (i) is obtained from an intensity-duration-frequency (I-D-F) graph. Two methods can be used for obtaining I-D-F information: 1) two generalized I-D-F graphs are provided that can be used for any site in Arizona, and 2) a site-specific I-D-F graph can be developed, if desired. The two generalized I-D-F graphs are shown in Figure 2-1 for Zone 6, and Figure 2-2 for Zone 8, respectively. The delineation of the two rainfall zones for Arizona is shown in Figure 1-1 of Chapter 1 - Rainfall. Procedures for developing a site-specific I-D-F graph are described in Chapter 1.

The intensity (i) in Equation 2-1 is the average rainfall intensity for rainfall of a selected return period from an I-D-F graph for a rainfall duration that is equal to the time of concentration (T_C) as calculated according to the procedure described below. A minimum rainfall duration of 10 minutes is to be used if the calculated T_C is less than 10 minutes. The Rational Method should not be used if the calculated T_C is greater than 60 minutes.

2.2.5 Estimation of Time of Concentration (T_C)

Time of concentration (T_C) is to be calculated by Equation 2-2:

$$T_C = 11.4 L^{0.5} K_b^{0.52} S^{-0.31} i^{-0.38} \quad (2-2)$$

Note: Reference Papadakis and Kazan, 1987.

where T_C = the time of concentration, in hours,
 L = the length of the longest flow path, in miles,
 K_b = the watershed resistance coefficient,
 S = the slope of the longest flow path, in ft/mile, and
 i = the average rainfall intensity, in inches/hr, for a duration of rainfall equal to T_C (the same (i) as Equation 2-1) unless T_C is less than 10 minutes, in which case the (i) of Equation 2-1 is for a 10-minute duration).

The longest flow path will be estimated from the best available map and the length (L) measured from the map.

FIGURE 2-1
GENERALIZED I-D-F GRAPH FOR ZONE 6 OF ARIZONA

Example: For a selected 10-year return period, $P_1 = 2.0$ inches. T_C is calculated as 20 minutes. Therefore, $(i) = 4.25$ in/hr.

FIGURE 2-2
GENERALIZED I-D-F GRAPH FOR ZONE 8 OF ARIZONA

The slope (S), in ft/mile, will be calculated by one of two methods:

1. If the longest flow path has a uniform gradient with no appreciable grade breaks, then the slope is calculated by Equation 2-3;

$$S = \frac{H}{L} \quad (2-3)$$

where H = the change in elevation, in feet, along L, and
L = as defined in Equation 2-2.

2. If the longest flow path does not have a uniform gradient or has distinct grade breaks, then the slope is calculated by Equation 2-4:

$$S = 5,280 \left(\frac{d}{j} \right)^2 \quad (2-4)$$

where $d = 5,280 \times L$

$$j = \sum \left(\frac{d_i^3}{H_i} \right)^{1/2}$$

Note: Reference, Pima County Department of Transportation and Flood Control District, September 1979.

and d_i = an incremental change in length, in feet, along the longest flowpath and

H_i = an incremental change in elevation, in feet, for each length segment, d_i .

The resistance coefficient (K_b) is selected from Table 2-1. Use of Table 2-1 requires a classification as to the landform and a determination of the nature of runoff; whether in a defined drainage network of rills, gullies, channels, etc., or predominantly as overland flow.

TABLE 2-1
RESISTANCE COEFFICIENT (K_b) FOR USE WITH THE
RATIONAL METHOD T_c EQUATION

Description of Landform	K_b	
	Defined Drainage Network	Overland Flow Only
Mountain, with forest and dense ground cover (overland slopes - 50% or greater)	0.15	0.30
Mountain, with rough rock and boulder cover (overland slopes - 50% or greater)	0.12	0.25
Foothills (overland slopes - 10% to 50%)	0.10	0.20
Alluvial fans, Pediments and Rangeland (overland slopes - 10% or less)	0.05	0.10
Irrigated Pasture ^a	—	0.20
Tilled Agricultural Fields ^a	—	0.08
URBAN		
Residential, L is less than 1,000 ft ^b	0.04	—
Residential, L is greater than 1,000 ft ^b	0.025	—
Grass; parks, cemeteries, etc. ^a	—	0.20
Bare ground; playgrounds, etc. ^a	—	0.08
Paved; parking lots, etc. ^a	—	0.02

Notes: a - No defined drainage network.
b - L is length in the T_c equation. Streets serve as drainage network.

The solution of Equation 2-2 is an iterative process since the determination of (i) requires the knowledge of the value of T_C . Therefore, Equation 2-2 will be solved by a trial-and-error procedure. After L , K_p , and S are estimated and after the appropriate I-D-F graph is selected or prepared, a value for T_C will be estimated (a trial value) and (i) will be read from the I-D-F graph for the corresponding value of duration = T_C . That (i) will be used in Equation 2-2 and T_C will be calculated. If the calculated value of T_C does not equal the trial value of T_C , then the process is repeated until the calculated and trial values of T_C are acceptably close (a difference of less than 10 percent should be acceptable).

2.2.6 Selection of Runoff Coefficient (C)

The runoff coefficient (C) is selected from Figure 2-3 through Figure 2-8 depending on the classification of the nature of the watershed. Figure 2-3 is the C graph to be used for urbanized (developed) watersheds. Select the appropriate curve in Figure 2-3 based on an estimate of the percent of effective impervious area in the watershed. Effective impervious area is that area that will drain directly to the outlet without flowing over pervious area. (Refer to Chapter 3 - Rainfall Losses, 3.1.1 and Table 3-3, for discussion of effective impervious areas.) Figure 2-4 through Figure 2-8 are to be used for undeveloped (natural) watersheds in Arizona, and the C graphs are shown as functions of Hydrologic Soil Group (HSG) and percent vegetation cover. The Hydrologic Soil Group is used to classify soil according to its infiltration rate. The Hydrologic Soil Groups, as defined by USDA, Soil Conservation Service (SCS), 1972 are:

<u>HSG</u>	<u>Definition</u>
A	Soils having high infiltration rates even when thoroughly wetted and consisting chiefly of deep, well to excessively drained sands and gravels. These soils have a high rate of water transmission.
B	Soils having moderate infiltration rates when thoroughly wetted and consisting chiefly of moderately deep to deep, moderately well to well drained soils with moderately fine to moderately coarse textures. These soils have a moderate rate of water transmission.

Luke Sefton, PE, CFM
Tim Huskett, PE, CFM
Robert Lane, Public Lands
Cheri Baker, Office Manager
Crockett Saline, PE
David Nicolella, Planner
Leonard Filner, Planner

HSG

Definition

- C** Soils having slow infiltration rates when thoroughly wetted and consisting chiefly of soils with a layer that impedes downward movement of water, c soils with moderately fine to fine texture. These soils have a slow rate of water transmission.
- D** Soils having very slow infiltration rates when thoroughly wetted and consisting chiefly of clay soils with a high swelling potential, soils with a permanent high water table, soils with a claypan at or near the surface, and shallow soils over nearly impervious material. These soils have a very slow rate of water transmission.

The percent vegetation cover is the percent of land surface that is covered by vegetation. Vegetation cover is evaluated on plant basal area for grasses and forbs, and on canopy cover for trees and shrubs (see Appendix C).

Information on Hydrologic Soil Group and percent vegetation cover can usually be obtained from the detailed soil surveys that are prepared by the SCS. When detailed soil surveys are not available for the watershed, then the general soil maps and accompanying reports by the SCS for each county in Arizona are to be used. A site visit is encouraged to confirm watershed and soil conditions.

It may be required to select the appropriate C value for existing conditions and another C value for anticipated future conditions, if the watershed is undergoing development. Estimation of peak discharges for various conditions of development in the drainage area or for different periods will also require separate estimates of T_C for each existing or assumed land-use condition and for each flood return period.

Aug 23, 2024

Sedona Community Development Department
 102 Roadrunner Dr. Bldg. 104
 Sedona, AZ 86336

Subject: Canyon Vista Subdivision Preliminary Plat – Traffic Impacts

Dear Sedona Community Development Department,

Sefton Engineering has prepared this Traffic Generation Assessment as required by the City of Sedona by the Community Development Design, Review, Engineering, and Administrative Manual for the proposed subdivision preliminary plat of the property located off Brewer Rd and identified as APN 401-20-027G in Coconino County, Arizona. More specifically, it is located in the NW ¼ of the NE ¼ of Section 18 of Township 17 North, Range 6 East of the Gila-Salt River Principal Meridian.

The proposed development includes 11 lots. The property is in an area zoned RS-10 while some surrounding areas that abut the parcel are zoned RS-18, PD, and NF. Brewer Rd must be accessed from W State Route 89A or Ranger Rd. Access for the proposed subdivision will be off Brewer Rd. approximately 0.1 miles north of Juniper Ln and 0.35 miles south of Ranger Rd. Brewer Rd is classified as a collector road and SR-89A is classified as a Major Arterial Road. The posted speed limit on Brewer Rd is 25 MPH and the posted speed limit on SR-179 is 35 MPH.

The Institute of Transportation Engineers (ITE) Trip Generation Rates 10th Edition was used to obtain the trip generation rates for the proposed development based on eleven single-family homes. These estimations were calculated for the Average Weekday, AM Peak Hour and PM Peak Hour using land use Variety Store (ITE Code 210). The results of the calculations are shown below:

Land Use	ITE Code	Intensity	Average Weekday	AM Peak Hour			PM Peak Hour		
				In	Out	Total	In	Out	Total
Trip Generation Rates									
Single-Family Detached Housing	210	1 du	9.44	25%	75%	0.75	63%	37%	99%
Trip Generation Summary									
Description	Size	Average Weekday	AM Peak Hour			PM Peak Hour			
			In	Out	Total	In	Out	Total	
<i>PROPOSED USE</i>									
Single-Family Detached Housing	11	103.84	2.063	6.188	8.25	6.93	4.07	10.89	
Proposed Project Trips			103.84	2.063	6.188	8.25	6.93	4.07	10.89

Luke Sefton, PE, CFM
Tim Huskett, PE, CFM
Robert Lane, Public Lands
Cheri Baker, Office Manager
Crockett Saline, PE
David Nicolella, Planner
Leonard Filner, Planner

It is shown in the table above that this subdivision will generate approximately 11 traffic movements during the PM peak hour. It will have minimal impact on traffic counts.

Sincerely,

Luke Sefton, P.E., CFM

Sedona Community Development Department
 102 Roadrunner Dr. Bldg. 104
 Sedona, AZ 86336

Subject: Canyon Vista Subdivision Preliminary Plat – Sanitary Sewage and Water Supply

Project Overview & Location

The purpose of this report is to calculate demand for sanitary sewage and water supply for the proposed Canyon Vista subdivision on Brewer Road in Sedona. It is proposed that eleven lots be included in the subdivision. Identified as APN 401-20-027G in Coconino County, Arizona. More specifically located in the NW ¼ of the NE ¼ of Section 18 of Township 17 North, Range 6 East of the Gila-Salt River Principal Meridian.

The proposed subdivision is located near existing infrastructure. There is a sanitary line on Brewer Road maintained by the City of Sedona that services these properties. Water supply will be accessed from Brewer Road where an existing water line is maintained by the Arizona Water Company. This parcel contains approximately 5.74 Acres.

Water Demands

For this report total water demand for the development is based on the typical average water usage for each building. If each parcel is assumed to have a future single-family residence, then an average of 2.50 people per household is assumed. According to the *Arizona Department of Water Resources* on average, each Arizona resident uses about **120 gallons per day (gpd)**. This means that there will be approximately 300 gallons per day per household.

The City of Sedona does not publish any peaking factors therefore, the accepted values from Arizona Water Company were used to set Max-Day and Peak-Hour peaking factors. According to the company, the Max-Day Demands have a peaking factor of 2.0 times the Average-Daily Demand. Peak-Hour Demands have a peaking factor of 3.0 times the Average-Daily Demand. Water demands under full build-out conditions were calculated as shown in Table 1.

Table 1: Water Demand Calcs

Water Demand Calcs	
Given:	
Parcels =	11 Parcels
Residents =	2.5 People/parcel
Resident Demand =	120 Gal/day
Results:	
Household Demand =	300 Gal/day per hosue
Total Demand =	3300 Gal/day
	2.29 GPM

140505

40 Stutz Bearcat Dr., Sedona, Arizona 86336 ~Phone: (928) 202-3999
Email: info@sefengco.com ~ www.SeftonEngineeringCompany.com

In affiliation with:
Heritage Land Surveying & Mapping, Inc. with offices in Sedona, Camp Verde & Colorado

Table 2 : Water Demand Design Flows

Building ID	Average Daily Water Demand (GPD)	Average Day Water Demand (GPM)	Max Day Peaking Factor	Max Day Water Demand (GPM)	Peak Hour Peaking Factor	Peak Hour Water Demand (GPM)
11 Single Family Residences	3300	2.29	2.00	4.58	3.000	6.88
Total	3300	2.29		4.58		6.88

Total estimated design demands for six future single-family residences are summarized below:

- Average Daily Demand: 3300 gallons per day (GPD) or 1.67 gallons per minute (GPM)
- Maximum-Day Demand: 4.58 gallons per minute (GPM)
- Peak-Hour Demand: 6.88 gallons per minute (GPM)

Sanitary Sewage

A sewer extension will be designed to provide service to the Canyon Vista subdivision. Assuming that each residence is on average four bedrooms with more than 28 fixtures then the design flow would be 750 GPD of sanitary sewage wastewater. If all lots are built out to this assumption, then there will be approximately 68,250 GPD of wastewater produced from this subdivision to contribute to the City of Sedona Wastewater system. This translates to an estimated **5.73 GPM** of wastewater disposal.

Fire Protection

The fire & life safety requirements for the City of Sedona Fire Department require that a fire hydrant be placed so that a structure does not exceed 600 feet. An existing fire hydrant has not been located near the proposed development. If any portion of a structure exceeds 600 ft then an intermediate fire hydrant will be required. The required fire flow for the building shall meet a minimum of 1,500 gallons per minute (GPM) or the available GPM in the water delivery system at 20 psi, whichever is less.

Conclusion

After due diligence of the existing infrastructure and some analysis of future development, there will be sufficient services to provide water supply and wastewater disposal on site. No critical issues were identified that would preclude the anticipated development presented in this report. As mentioned above, it is estimated that the subdivision will require a max of **6.88 GPM** of water and **5.73 GPM** of wastewater disposal.

Sincerely,

Luke Sefton, PE, CFM

ENGINEERING & TESTING CONSULTANTS, INC.

May 14, 2007

Mr. William Heyer
Texona Investments
3205 Greenlee Drive
Austin, TX 78703-1622

SUBJECT: GEOTECHNICAL OBSERVATION FOR CANYON VISTA, SEDONA, AZ

Dear Mr. Heyer:

As requested, Engineering & Testing Consultants, Inc., (ETC) has completed the geotechnical observation for the subject project referenced above. The purpose of this exploration is to determine the general subgrade soil conditions for pavement thickness design, constructed slopes, and soil design factors.

This report discusses the general site conditions, laboratory test results, and provides pavement structure recommendations, recommended cut slope angles, and suggested construction procedures and design parameters. These services were provided following accepted soil mechanics and engineering practices. We make no other warranty, either implied or expressed. If soil conditions are encountered during construction that differ from those presented herein, this firm should be notified for evaluation.

PROJECT AND SITE CONDITIONS

The subject project is generally located on the west side of Brewer Road, between Juniper Lane and Procnow Road. ETC understands that the development will include 8 custom residential lots. A "hammer head" entrance road will be constructed, approximately 170 feet in length. One private drive will begin at the "hammer head" for access to interior lots. A second private drive will come off Brewer Road, just north of the main access road.

Mr. William Heyer – Texona Investments
Geotechnical Engineering Services – Canyon Vista, Sedona, AZ
May 14, 2007
Page 2 of 6

The proposed roadway alignments have been rough graded. We were informed that this occurred in the 1970's.

There is a significant cut slope exposed along the northeast side of Lot 3, up to approximately 10 feet in height. The cut exposes firm soils and highly weathered/fractured to decomposed rock material. The other existing cut slopes are much smaller, and exposed moderately fractured rock with relatively horizontal and vertical fracture planes.

The subgrade soils are generally comprised of low-plasticity, silty sand with gravel (Unified Soil Classification SM).

LABORATORY

Atterberg limits and gradation laboratory tests were performed for representative samples collected of the subgrade soils during the field operation. A summary of the laboratory test results are presented below in Table 1. Laboratory testing was performed in accordance with applicable ASTM standards.

**TABLE 1
SUMMARY OF LABORATORY TEST RESULTS**

Location	Liquid Limit (%)	Plasticity Index	Fines Content (%)	Gravel Content (%)	Unified Soil Classification
Southern Subgrade Soils	23	3	35	34	SM
Northern Subgrade Soils	---	Non-plastic	32	24	SM

PAVEMENT DESIGN

Site grading for pavement areas should be as outlined herein, to provide subgrade support of flexible pavements. The native materials will provide good support for pavement structure. The pavement sections presented in Table 2 are recommended for the proposed development. Due to the potential steep roadway grades, Portland cement concrete should be considered for roadway pavement.

**TABLE 2
PAVEMENT STRUCTURAL SECTION**

Roadway	Alternative	Portland Cement Concrete* Thickness (inches)	Asphaltic Concrete Thickness (inches)	Aggregate Base Thickness (inches)	Prepared Subgrade Thickness (inches)
Canyon Vista Drive	1	---	3	6	8
Private Drives	1	---	2.5	6	8
	2	5	---	4	8

*Note: Air-entrained concrete with a minimum 28-day compressive strength of 3,500 psi.

The recommended pavement sections are expected to function with periodic maintenance or overlays when the subgrade, base, and pavement are constructed in accordance with YAG construction standards with City of Sedona modifications.

Efficient surface and subsurface drainage should be established prior to and maintained during and after construction to prevent water from ponding and/or saturating the soils within or adjacent to roadway areas.

In design and construction, adequate setback should be provided between the back of curb and/or sidewalk to ensure efficient drainage is maintained in areas adjacent to the toe of a rock cut slope.

EARTHWORK

The areas where fill is required must be stripped of all vegetation, debris, or unstable soils and such material should be removed. Depressions and sloped ground should be widened or benched as necessary to accommodate compaction equipment and provide a level base for placing fill.

Existing fill soils were encountered at various locations along the roadway alignment. The existing fill material in the area of culvert crossings shall be removed and replaced in compacted lifts. In addition, loose fill soils were observed along the existing fill slopes, which shall be removed and benched back into firm soils prior to placement of any additional fill. Loose or otherwise inadequate fill material, if encountered during construction, shall be removed and replaced in compacted lifts, as determined by the engineer.

Prior to fill placement, the exposed ground surface should be scarified; moisture conditioned, and compacted to a minimum depth of 8 inches, except on exposed rock. Special attention shall be given to insure adequate moisture is present throughout the entire 8-inch depth.

All subbase fill required to bring the structured areas up to subgrade elevation should be placed in horizontal lifts not exceeding 8 inches compacted thickness. Fill soils in roadway areas, and backfill in utility trenches shall be compacted to a minimum relative density of 95% of maximum dry density at -2% to $+2\%$ of optimum moisture content, ASTM D698.

Many cobbles and boulders will likely be generated during the earthwork phases of the construction. During fill placement “nesting” of large cobbles or boulders should be avoided. An adequate amount of finer material should be mixed in with the coarser material to create a dense fill without the creation of voids. Fill material with a large amount of rock pieces will still need to be adequately moisture conditioned to provide for long term stability and a dense fill section.

ETC recommends the observation of the site grading operation with sufficient tests to verify proper compaction.

CONSTRUCTED SLOPES

ETC recommends that fill slopes be constructed at a maximum slope angle of 2H:1V. If boulder revetment will be placed on the slope face, fill slopes may be constructed up to 1.5H:1V.

Cut slopes in the firm soil and highly weathered to decomposed rock material, as encountered in the northeast portion of Lot 3, shall be constructed at a maximum slope angle of 1.25H:1V up to 12 feet in height.

The relatively intact, moderately fractured rock encountered elsewhere may be cut at a maximum slope angle of 0.6H:1V, up to 10 feet in height. The rock strata may be excavated in stepped method along relatively horizontal and vertical fractures, provided the overall slope angle conforms to the maximum recommended slope angle.

Natural fractures within the rock mass may dictate that portions of some cut slopes be constructed along natural fracture planes, which may be at steeper angles. Steeper cut slopes shall be observed and approved by the engineer for adequate stability. Cut slopes should be constructed with careful rock excavation.

Zones of softer/decomposed/highly-fractured rock may not be apparent until a cut slope is exposed. Such strata, if encountered during construction, may require local slope angles to be adjusted.

Unstable cobbles, boulders, or loose material on the face of the slopes, and near the top of the slopes shall be removed, to help prevent future dislodgment due to weathering.

Soil in the top of cut slopes should be rounded back from the slope face to create a gradual transition to natural grade. Surface water runoff may erode slope faces, causing portions of a slope to become unstable, or dislodging larger rocks. Therefore, surface drainage should be prevented from flowing down slope faces without adequate revetment material.

LIMITATIONS

The recommendations in this report were prepared in accordance with accepted professional engineering principles and soil mechanics practices. We make no other warranty, either implied or expressed. If during subsequent planning and construction, conditions are different than as indicated, this firm should be notified for evaluation.

This report is not a bidding document. Any contractor reviewing this report must draw his own conclusions regarding site conditions and specific construction techniques to be used on this project.

For your use. If you have any questions, please contact us at (928) 778-9001.

Sincerely,

ENGINEERING & TESTING CONSULTANTS, INC.

Richard G. Kelley, P.E.
